## BRIDGE LOADINGS ROUND THE WORLD

The Indian Roads Congress issued a questionnaire to various countries in the world about the bridge loadings applied for design purposes.

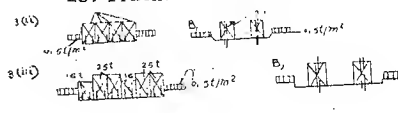

The following countries very kindly sent the replies:

- (1) America (U.S. Bureau of Public Roads)
- (2) Austria
- (3) Belgium—see pp. 128-129
- (4) Canada (Toronto and Ontario)
- (5) Finland
- (6) Germany (Federal Republic)
- (7) Great Britain
- (8) India
- (9) Italy
- (10) Japan
- (11) Malaysia
- (12) New South Wales (Australia)
- (13) New Zealand
- (14) Norway
- (15) Philippines
- (16) Rhodesia
- (17) Sweden
- (18) Switzerland
- (19) Turkey

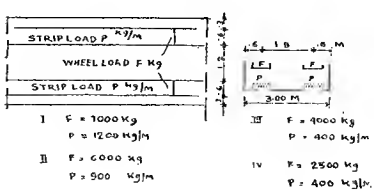

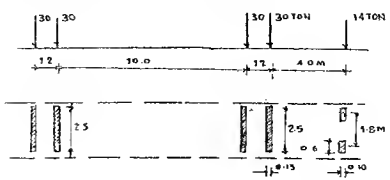

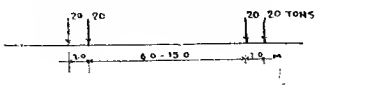

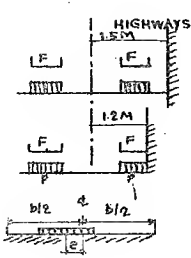

The ensuing Tables have been prepared from the information received.

The Indian Roads Congress is very grateful to the above mentioned countries for the information supplied.

## Transport-Communications Monthly Review

QUESTIONS	AMERICA (U.S. Bureau of Public Roads)	AUSTRIA			
		Bridge Classes	See Fig. 6 in Plate I		
1. LOADINGS	Article 1.2.5*	Total weight	tonnes	25	16
(i) Design train loading truck loading or any special loading for each category of roads.	(i) Truck loading and lane loading H10-44, H15-44, H20-44, H15-S12-44, H20-S16-44 and Military loading. (See Figs. 1, 2, 3 & 4 in Plate I).  For trunk highways or other highways which carry heavy truck traffic, minimum loading H15-S12-44.  For Inter-state highway system, Military loading (see Fig. 4 in Plate I) wherever it causes moments or shear greater than those caused by H20-S16 truck or the standard lane loading.	(a) Truck			
		Fore wheel	tonnes	4	2.5
		Back wheel	tonnes	8.5	5.5
		Equivalent weight	tonnes/m <sup>2</sup>	1.67	1.07
		(b) Uniform load	tonnes/m <sup>2</sup>	0.50	0.40
		(c) Caterpillar Car			
		Total weight	tonnes	60	—
		Caterpillar load	tonnes/m <sup>2</sup>	17.14	—
		Equivalent weight	tonnes/m <sup>2</sup>	3.33	—
		For spans more than 30 m, calculations may be made with the "Equivalent weight" (total weight, referred to the track area) instead of the different wheel loads.			
(ii) Distance between successive trains or loads	(ii) No successive trains or loadings.				
(a)					
(b)					
(c)					
(d)					
(e)					
2. Lateral disposition of train loading or other types of loadings with respect to :	Article 1.2.6*				
(a) Kerb	(a) Distance from kerb to centre line of wheel—2 ft (for slab design—1 ft). (see Figs. 1 and 3 in Plate I).	(a) The standard trucks, 2.5 m wide, are equal to the width of a lane; therefore the trucks have to be put close together, so that the live load for the considered structural part arises to a maximum. It is not necessary to shift the wheels of the trucks to the kerb.			
(b) Central line of the bridge	(b) No particular lateral disposition.	(b) The caterpillar, as the only load on the roadway, has a maximum deviation of 0.5 m on both sides from the centre line of the roadway.			
3. No. of train loadings taken for design of each span of bridges and culverts with the following number of traffic lanes :	Articles 1.2.7, 1.2.8, 1.2.9*	<p><b>Bridge Class I :</b> The calculation has to be executed for : (A) on 2 adjoining lanes, 1 truck of 25 t each. On every other of the following lanes, 1 truck of 16 t. The rest of roadway and footpath to be covered with uniformly distributed load of 0.5 t per metre. (B) For a caterpillar of 60 tonnes only, also see 2(b) above.</p> <p><b>Bridge Class II :</b> On 2 adjoining lanes, one 16 t truck each. The rest of the roadway and footpath to be covered with uniformly distributed load of 0.4 t per sq. metre.</p> <p>60 t CATERPILLAR</p> <p>3 (ii) 25t Trucks</p> <p>3 (iii)</p> 			
(i) Two lanes	(i) 100 per cent of either 2-lane loading or one standard H or H.S. truck per each lane.				
(ii) Two lanes each way on a divided highway	(ii) 75 per cent of either 4 lane loading or one standard H or H.S. truck per each lane.				
(iii) Three lanes each way on a divided highway	(iii) 75 per cent of either 6 lane loading or one standard H or H.S. truck per each lane.				
	Note : In case of a 3-lane bridge, 90 per cent of the full live load.

QUESTIONS		FEDERAL REPUBLIC OF GERMANY	GREAT BRITAIN
1. LOADINGS			
(i) Design train loading truck loading or any special loading for each category of roads.			

## GREAT BRITAIN

bridges carrying public roads are designed for HA loading (British Standard Part 3-Section A—see Fig. 8 in Plate II) consisting of a uniformly distributed load of a single knife edge load. The U.D. varies with the span but between 20 ft it is constant at 2200 lb per linear ft of 10 ft wide lane. The knife edge is placed parallel to the supports of the beam under consideration and has a value of 27,000 lb for a 10 ft wide lane.

bridges carrying important roads are designed for 45 units of HB loading to BS Standard 153.

Any part of the bridge deck between kerbs, including the hard shoulder, if any, is deemed to be subject to HA or HB loading.

Two lanes of HA loading or one lane of HB loading together with one lane of 1/3 HA loading.

Two lanes of HA loading and two lanes of 1/3 HA loading or one lane of HB loading and the adjacent lane with 1/3 HA loading. The two lanes in the other carriageway each with HA loading.

Two lanes of HA loading and four lanes of 1/3 HA loading or one lane of HB loading and the two adjacent lanes with 1/3 HA loading. In the other carriageway, two lanes with HA loading and the other lane with 1/3 HA loading.

## INDIA

## Clauses 201\* and 207\*

- (i) Class "AA" tracked vehicle and Class "AA" wheeled vehicle.  
Class "A" train of vehicles.  
Class "B" train of vehicles.  
(See Figs. 9, 10 & 11 in Plate III)

(a) For every 2-lane width of bridge Class "AA" one tracked or wheeled vehicle or two lanes of Class "A" loading whichever creates worst effects, to be used for road bridges in municipal limits, industrial and other specified areas and on specified highways.

(b) Class "A" to be used for all roads on which permanent bridges and culverts are constructed.

(c) Class "B" for temporary bridges, etc.

- (ii) See Figs. 9, 10 & 11 in Plate III

For Class "AA" tracked vehicles—  
300 ft min.

For Class "A" train of vehicles—  
65 ft min.

For Class "B" train of vehicles—  
65 ft min.

## Clause 207\* (See Figs. 9 to 11, Plate III)

- (a) Class "AA" clear distance between kerb and outer edge of wheel or track = 1 ft for single lane bridge with 12 ft carriageway; 2 ft for multi-lane bridge with less than 18 ft carriageway; 4 ft for 18 ft or above carriageway.  
In case of Class "A"—clear distance 6 in. between kerb and wheel having 20 in. width for all carriageway widths. Class "B" 6 in. for wheel having 15 in. width.

(b) Not given.

## Clauses 113\* and 208.2\*

- (i) One train of Class "AA" tracked or wheeled vehicles or two lanes of Class "A" train of vehicles for National Highways and State Highways.

(ii) 80 per cent of two trains of Class "AA" tracked or wheeled vehicles or of four lanes of Class "A" train of vehicles.

(iii) This type of bridge construction is not permitted.

## ITALY

For the purpose of loading, highways are divided into the following two categories.:

- (I) Highways for civil and military use, and  
(II) Highways for civil use only (local and minor roads).

## Loading system.

Type 1, a continuous train of 12 t truck

„ 2, a single 18 t steam roller

„ 3, a crowd load of 400 kg per sq. m.

„ 4, a continuous train of military loads of 61.5 t

„ 5, a continuous train of military loads of 32 t

„ 6, a single military load of 74.5 t

(See Fig. 13 in Plate—IV)

Loading system to be adopted in the design of highway bridges.

Category (I)—One military type—the heaviest of types 4, 5 or 6 flanked by one or more trains of truck (Type 1) with crowd loading of 400 kg/m<sup>2</sup> (Type 3) on the footpaths.

Category (II)—The most unfavourable of the following conditions:

(a) one or more lanes loaded with continuous trains of trucks (Type 1) with crowd loading on the footpaths (Type 3)

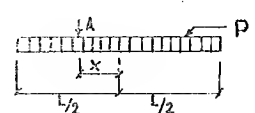

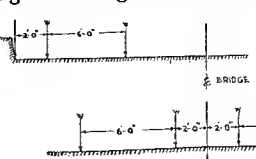

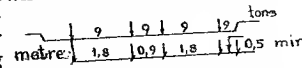

(b) one or more steam rollers (Type 2) side by side with crowd loading on footpaths (Type 3).

No details given.

No details given.

each lane.

<p>(i) Two lane loading or single truck loading.</p> <p>(ii) Each side of the divided highway shall essentially be regarded as belonging to a separate bridge. However, in some cases on long bridges, certain deduction in the loading is often allowed.</p>	<p>(i) Not more as two lanes are loaded with axle or train loads.</p> <p>(ii) &amp; (iii) Not more as two lanes each way have to be loaded with axle or train loads.</p>	<p>One truck for each lane.</p>																				

QUESTIONS	AMERICA (U.S. Bureau of Public Roads)	AUSTRIA	CANADA
4. Area of the train of vehicle assumed in elevation for calculating the effective wind pressure.	Article 1.2.14*  Wind pressure at the rate of 100 lb per linear ft on moving live load acting at 6 ft above deck. This is to be taken only for group loading combination as explained in Article 1.4.1*.	The Austrian standards adopt a 2.5 m high rectangular traffic area in correspondence with the position of live load.	<b>TORONTO</b>  A simplified procedure is used for spans 125 ft and under.  100 lb per linear ft transversely.  40 lb per linear ft longitudinally.  Both forces applied simultaneously 6 ft above deck.  <b>ONTARIO</b>  Article 1.2.14*
5. Impact factor due to live loads assumed for different types of loads on :  (i) Concrete bridges   			

\*Articles referred to relate to the A.A.S.H.O. Standard Specifications for Highway Bridges (1961).

	FINLAND	FEDERAL REPUBLIC OF GERMANY	GREAT BRITAIN	TURKEY
to be re.	Height 2 m for the length of loading.	For bridges without load—250 kg/m <sup>2</sup> For bridges under construction—125 kg/m <sup>2</sup> For bridges with load—125 kg/m <sup>2</sup> For pedestrian & cycle bridges—75 kg/m <sup>2</sup>  The above loading acting in case of (a) road bridges at 2.0 m height (b) pedestrian bridges at 1.8 m height.	A plane with a continuous height of 8 ft above the carriageway for highway bridges or 4 ft above the footway for foot-bridges. Allowance may be made for the screening effect of the structure on the plane, based on projected areas.	Effective wind pressure is calculated as follows:  for unloaded bridge: 5 times the height of the full area of the ridge deck including the hand-rails. Load 50 kg per m <sup>2</sup> .  for loaded bridges: eight of the area of the bridge deck elevation + 2.0 m for live load.
6 in.	I=40 per cent when filling h(m) ≥ 3 m  I=16 (3.0-h) per cent for height of fill varying from 0.5-3.0m  For timber bridges always I=20 per cent.	Impact Factor $\phi = 1.4 - 0.008 \times l\phi \geq 1.0$  $l\phi$ = governing length in metres  (See D.L.N. 1073, 1074, 1075 and 1078 for the determination of the value of $l\phi$ ).	HB loading has no impact factor.  HA loading incorporates an impact factor of 25 per cent on the heaviest axle in the train of vehicles from which HA loading is derived. It is constant for all forms of construction.	Wind load 125 kg per m <sup>2</sup> .

## QUESTIONS

4. Area of the train or vehicle assumed in elevation for calculating the effective wind pressure.

## NEW SOUTH WALES

## Clause 2.15\*

Lateral wind force at 100 lb per linear ft acting at a height of 6 ft above the deck.

Alternatively, 66 lb per linear foot laterally plus 33 lb per linear foot longitudinally acting simultaneously.

## NEW ZEALAND

Wind loads as per A.A.S.H.O. Specifications for longitudinal elevation.

See Fig. 3 in Plate I and sketch in Q. 1, p. 101.

## NORWAY

Normally no wind pressure is considered on loaded bridge.

On bridge without load, wind pressure is assumed equal to 250 kg per m<sup>2</sup> of exposed area.

## PHILIPPINES

See Figs. 1, 2 and 3 in Plate I.

G  
S

5. Impact factor due to live loads assumed for different types of loads on:

- (i) Concrete bridges

- (ii) Steel bridges

- (iii) Prestressed concrete bridges

Variation of impact according to span length.

## Clause 2.13\*

- (a) Impact=10 per cent for steel or concrete substructure above the foundations but not rigidly connected to the superstructure and structures carrying 1½ to 3 ft of fill.

- (b) Steel or concrete superstructures and those parts of steel or concrete substructure above the foundations which are rigidly connected to the superstructure as in the rigid frames or continuous designs and structures carrying less than 1½ ft of fill. The impact shall be

$$I = \frac{5000}{L+125} \text{ per cent}$$

(max. 30 per cent)

(min. 10 per cent)

Impact factor not dependent on bridge type. Impact factor in use:

$$I = \left( \frac{50}{L+125} \right) \times 100 \text{ per cent}$$

Impact is included under Q. 1—equivalent loading.

The local loading (Q. 2) assumes 5 t impact for an allowable 13 t axle load (38.5 per cent)

Allowable gross weights of vehicles are established by comparing their effect with the effect of the class II equivalent loading.

By this, the above 38.5 per cent impact is added to the heaviest axle, but it is so far considered unnecessary to add impact to the remaining axles.

For all kinds of bridges,

$$I = \frac{50}{L+125} \text{ in which}$$

I=impact fraction (maximum 30 per cent)

L=length in feet of the portion of the span which is loaded to produce the maximum stress in the member.

\*Articles referred to

\*Clauses referred to relate to Highway Bridge Design Specifications of N.A. of A.S. Road Authorities (1965).

RHODESIA	SWEDEN	SWITZERLAND	TURKEY
As under Section 12— B.S. 153/1954—Part 3, Section "A".	The wind pressure area of traffic load shall be supposed to be a rectangle 2 metre higher from the deck and length equal to loaded length.	For road bridges, 3 metre high band is assumed.	Effective wind pressure is calculated as follows :  (a) for unloaded bridge : 1.5 times the height of the full area of the bridge deck including the hand-rails. Load 250 kg per m <sup>2</sup> .  (b) for loaded bridges : height of the area of the bridge deck elevation + 2.0 m for live load.  Wind load 125 kg per m <sup>2</sup> .
<p>(i) &amp; (ii) Concrete and steel bridges—Included in HA loading. Front Wheel

Rear Wheel

QUESTIONS		Transport-Communications Monthly Review		ITALY
6. Ground Contact Area	l A P F A	INDIA		
The shape of contact area for design calculations and formulae adopted for dispersion of the wheel loads through the wearing coat and the slab for designing.		Clauses 207 and 207-2.* Sec Figs. 9, 10 and 11 in Plate III, for shape of contact areas. For one way slab dispersion=effective width measured parallel to the supported edges : $e=kx \left( 1 - \frac{z}{l} \right) + W$ and $e=1.2x + W$ for cantilever. Effective dispersed length of slab (in the direction of span)= dimension of tyre contact area in the direction of span+twice the thickness of slab and wearing coat. For two way slabs, dispersion as per rational method.		In slab calculations, the weight of a rear wheel (6t) of the roller is distributed over a rectangle, one side of which is equal to the sum of the width of the roller wheel plus twice the depth of slab and wearing coat; the other side is equal to 10 cm plus twice the depth of slab and wearing coat. For the bridge on highway of category I, an additional calculation must be made in respect of the two rear axles, each of 18t, of load in Type 6. In such a case, the total load of the two axles must be distributed over a rectangle with sides of $2.65 \times 1.12\text{m}$ each side being increased by twice the depth of slab and wearing coat. Normally the calculation is carried out for a slab When the lengths of the sides differ substantially, the slab can be considered as being bound by the longer sides, increasing the rectangular distribution in the direction of those sides by one half of the shorter side. <b>On main beams</b> In considering transverse distribution, the loading should be so placed as to give the most unfavourable effects. In the case of beam and slab construction, if a rigorous calculation is not made based on the theory of slabs, then all the beams should be similar and designed to carry the increased edge stresses.
7. Equivalent UDL or knife edge loading, if adopted for working out :  (i) Bending moment.  (ii) Shear.	Arti. See :	Nil		See Table 2 page 131
8. The percentage of the live load on the bridge taken for calculating the braking force in the design of substructure of the bridge.	Article 5 per cent out im. carryin in the acting The lo. load pl without reducti applied forces c beams s ived f	Clause 214-2* (a) 20 per cent of the first train load plus 10 per cent of the loads of succeeding trains or part thereof, the train loads in one lane only being considered for this purpose. When only part of the first train is on the full span, the braking force shall be only 20 per cent of portion of load on the span. (b) For bridges having more than two lanes : as in (a) above for the first two lanes plus 5 per cent of the loads on the lanes in excess of two. (Effect of impact is not taken into consideration).		Braking force shall be equal to 1/10 of the load superimposed by a continuous train of trucks (Type 1). This force, however, shall not be less than 0.3 of the heaviest axle of the load system being considered.

## 6. Ground Slab

### 1. Normal train loading

Over traffic lane 2.50 m<sup>2</sup> minimum wide to 4 m maximum wide and simultaneously a load of 400 kg per m<sup>2</sup> uniformly distributed on the carriageways and footpaths.

### 2. Lateral disposition of train loading

### 3. Number of train loadings

One train loading over traffic lane plus a load of 400 kg per m<sup>2</sup>.

### 4. Effective wind pressure

The area of the train of vehicles assumed in elevation is a rectangular screen 2 m high with a length equal to the length of the train.

### 5. Impact factor

The impact factor due to live loads is the same for in question No. 1—i, ii, iii; and is given by the following formula :

$$\phi = 1 + 0.377 \frac{v}{\sqrt{l\alpha}} \sqrt{1 + \frac{2Q}{P}}$$

where

$v$  = speed in kilometre per hour, always greater than 60

$l$  = distance between supports, in metre

$$\alpha = \frac{l}{f_s}$$

$f_s$  = static deflection, in metre, due to dead weight

$Q$  = moving loads on the bridge deck, in tonnes

$P$  = deadweight of the bridge, in tonnes

## 6. Ground contact area

Slab bearing in one direction

Slab bearing on four sides

$$l_1 = b + 2h_0 + \frac{ld}{3}$$

$$l_2 = a + 2h_0$$

$$l_1 = a + 2h_0 + \frac{ld}{2.5}$$

$$l_2 = a + 2h_0$$

$ld$  = span of the slab  
 $h_0$  = width of the slab

## 7. Equivalent U.D.L.

There are no regulations.

## 8. Braking force

The braking force is equal to 1/20 of the load 400 kg per m<sup>2</sup> (without impact factor) distributed on the entire surface of the bridge deck or, if it is more unfavourable, 3/10 of the wheel loads placed on the deck.

## 9. Surcharge effect

The surcharge effect considered in the design of abutments of the bridge is equal to the live loads considered for calculating the bridge.

## 10. Footpath loading

crowd load = 400 kg per m<sup>2</sup> with impact factor

minimum width : 1 metre

special loading : 1000 kg situated at 40 cm from the hand-rails.

## 11. Footbridges

(i) no regulations

(ii) loading 400 kg per m<sup>2</sup> for urban and rural areas

(iii) a horizontal and transverse load of 100 kg per metre run on the hand-rails.

## 12. Impact due to floating objects

(i) no regulations

(ii) the impact is equal to 5% of the weight of vessels and it is assumed to have an influence 1 m above the water level.

(iii) no regulations.

TABLE 1  
TABLE OF EQUIVALENT HEIGHTS (H) OF SURCHARGE OF  
EARTH

Depth of abutment below the road level in feet	H in feet for the concentrated surface loads due to the wheel or track loads of the following I.R.C. Standard Loadings					
	I.R.C. CLASS AA LOADING		I.R.C. CLASS A LOADING		I.R.C. CLASS B LOADING	
	Single-lane bridges	Multi-lane bridges	Single-lane bridges	Multi-lane bridges	Single-lane bridges	Multi-lane bridges
1	84.6	50.8	46.8	56.4	28.2	33.8

8	26.4	15.8	14.6	17.6	8.8	10.6
9	24.1	14.5	13.4	16.1	8.1	9.7
10	22.4	13.4	12.4	14.9	7.5	8.9
12	19.4	11.6	10.7	12.9	6.5	7.7
14	17.1	10.3	9.5	11.4	5.7	6.8
15	16.2	9.7	9.0	10.8	5.4	6.5
16	15.3	9.2	8.5	10.2	5.1	6.1
18	13.8	8.3	7.6	9.2	4.6	5.5
20	12.6	7.6	7.0	8.4	4.2	5.0
22	11.6	6.9	6.4	7.7	3.9	4.6
24	10.8	6.5	6.0	7.2	3.6	4.3
25	10.4	6.2	5.7	6.9	3.5	4.1
26	10.1	6.0	5.6	6.7	3.4	4.0
28	9.5	5.7	5.2	6.3	3.2	3.8
30	8.9	5.3	4.9	5.9	3.0	3.5
32	8.4	5.0	4.6	5.6	2.8	3.4
and above						

Note :—The above figures are based on the following values for the constants for the abutments and the backfill :

- (1) Length of abutment ( $L$ ) = 15 ft for single-lane bridges and 25 ft for multi-lane bridges.
  - (2) Angle of internal friction of the backfill ( $\phi$ ) =  $30^\circ$
  - (3) Wt of backfill ( $W$ ).....100 lb per cu. ft.
  - (4) The resultant earth pressure acts in a horizontal direction.
- For different values, say,  $L_1$ ,  $\phi_1$  and  $W_1$  for the constants, the figures given in the above Table should be multiplied by the following factors :

$$\frac{L \text{ (15 or 25 as the case may be)}}{L_1} ; \frac{(1 + \sin \phi_1)}{3(1 - \sin \phi_1)} \text{ and } \frac{100}{W_1} \text{ respectively.}$$

\*In calculations, distribution of loads (Front Wheel-Rear Wheel) should be taken as 1:2.

GREAT BRITAIN

Fig. 8.

Figs. and Tables referred to above relate to British Standard Highway Loadings, B.S. 153: Part 3, Section A-1954

INDIAN ROADS CONGRESS BRIDGE LOADINGS

Class A train of vehicles

Class B Train of Vehicles

Notes:

1. The nose to tail distance between successive trains shall be 60 feet.
2. No other live load shall cover any part of the carriageway when a train of vehicles (or trains of vehicles in a multi-lane bridge) is crossing the bridge.
3. The ground contact area of the wheels shall be as under:

Axle load lb	Ground contact area	
	B in inches	W in inches
25,000	10	20
15,000	8	15
9,000	6	8

4. The minimum clearance,  $f$ , between the outer edge of the wheel and the roadway face of the kerb, and the minimum clearance,  $g$ , between the outer edges of passing or crossing vehicles on multi-lane bridges shall be as given below:

Clear carriageway width	$g$	$f$
18 ft to 24 ft	Uniformly increasing from 1 ft 4 in. to 4 ft	6 in. for all widths
Above 24 ft	4 ft	6 in.

Clear carriageway width	$g$	$f$
18 ft to 24 ft	Uniformly increasing from 1 ft 4 in. to 4 ft	6 in. for all widths
Above 24 ft	4 ft	6 in.

Class A train of vehicles  
Driving vehicle  
(Clause 207.1)

Fig. 10.

Notes:

1. The nose to tail distance between successive trains shall be 60 ft.
2. No other live load shall cover any part of the carriageway when a train of vehicles (or trains of vehicles in a multi-lane bridge) is crossing the bridge.
3. The ground contact area of the wheels shall be as under:

Axle load lb	Ground contact area	
	B in inches	W in inches
15,000	8	15
9,000	6	12
3,600	5	7

4. The minimum clearance,  $f$ , between the outer edge of the wheel and the roadway face of the kerb, and the minimum clearance,  $g$ , between the outer edges of passing or crossing vehicles on multi-lane bridges shall be as given below:

Clear carriageway width	$g$	$f$
18 ft to 24 ft	Uniformly increasing from 1 ft 4 in. to 4 ft	6 in. for all widths
Above 24 ft	4 ft	6 in.

Class B train of vehicles  
Driving vehicle  
(Clause 207.1)

Fig. 11.

Impact Percentage Curves for Highway Bridges for class A and class B loadings  
(Clause 211.2)

Fig. 12.

1965

Notes :

1. The nose to tail spacing between two successive vehicles shall not be less than 300 ft.

2. For multi-lane bridges and culverts, one train of Class AA tracked or wheeled vehicles, whichever creates severer conditions shall be considered for every two-traffic-lane width.

No other live load shall be considered on any part of the said 2-lane width carriageway of the bridge when the above mentioned train of vehicles is crossing the bridge.

3. The maximum loads for the wheeled vehicle shall be

20 tons for a single axle, or 40 tons for a bogie of two axles spaced not more than 40 ft centres.

4. The minimum clearance between the road face of the kerb and the outer edge of the wheel or track, C, shall be as under :

Carriageway Width	Minimum Value of C
<b>Single Lane Bridges</b>	
12 ft and above	1 ft-0 in.
<b>Multiple Lane Bridges</b>	
Less than 18 ft	2 ft-0 in.
18 ft or above	4 ft-0 in.

## BARAK BRIDGE

When completed this bridge will have the largest prestressed span of any bridge so far built in India.

The bridge will be 924 ft. long with deckings of 77 ft.—185 ft.—400 ft.—185 ft.—77 ft. span, providing a 24 ft. wide roadway. This “Cantilever” in-situ construction was done without staging, which ensured navigation during construction.

Prestressing has been done by the Freyssinet method.

Designed and constructed to the orders of the Chief Engineer (Roads) P.W.D., Shillong, Assam.

## FREYSSINET, ONCE AGAIN

An artist's impression of the Thana Creek Bridge

It is quite a job to hold together the enormous mass of cement concrete that goes into the construction of a bridge—especially more so when the bridge is the one now under construction across the Thana Creek to link Greater Bombay with a vast area of open land in Panvel. This road bridge, which is estimated to cost Rs. 236,00,000 will be 6,015 feet long and 49 ft. wide, and will have its central span as long as 175 ft. Engineers at Gammon India Limited, the designers of the bridge, specified the Freyssinet system for carrying out the task of prestressing, depending once again on the proven qualities of this system—ECONOMY and DEPENDABILITY—testified by the large number of structures built throughout India for more than 20 years now, using the Freyssinet Prestressing equipment and techniques.
